

Policy for the reduction greenhouse gases in the estate

HPL follows the system to reduce greenhouse gasses from their production activities and carried out the system to fix the greenhouse gasses with sustainable program.

- a. Identification of greenhouse gasses releasing sources.
- b. Sources of the greenhouse gases generation in the estate (Forest fire, waste burning, Cattle sheds, and Factory operations)

Carbon dioxide is the main greenhouse gas in the atmosphere. Therefore estates need for plan to reduce the greenhouse gasses through carbon dioxide fixing by the plants. The plants coverage increase by cover crop planting, agroforestry system establishment, fuel wood planting, and establishment of mini jungles.

As well as then prevent the waste burning in the estate premises and peoples also aware the prohibition of waste and open burning, forest fire generation. Another estate greenhouse gas generation source is cattle shed (methane). Peoples were aware how to dispose cattle waste in sustainable manner.
